Mr. W. G. Cochran,  
Statistical Department,  
Rothamsted Experimental Station,  
Harpenden, Herts,  
ENGLAND.

January 19th, 1938.

Dear Mr. Cochran,-

I have your letter of January 5th, with reference to the data used for my paper on, - "Replication in Relation to Accuracy in Comparative Crop Tests", appearing in the Journal of the American Society of Agronomy, Vol. 15, No. 5, May, 1923.

I am sending you a copy of the yields which we used in connection with this paper.

With regard to your postscript, enquiring as to the size of plot, - a part of the wheat range was harvested as single row plots, and the remaining part was harvested in plots 5 x 32 links. In oats the smallest size of plot was 5 x 32 links, although the whole range was not harvested in this manner.

The method of harvesting may be explained as follows, - The usual practice of laying out plots at the time that this experiment was carried on was to mark off the land into 1/40 acre plots 25 x 100 links and to leave an alleyway of 5 links between these. Such plots were sometimes sub-divided in the middle by another alley of 5 links, making 1/100 acre plots 10 x 100 links. In making my study in this experiment these 1/40 acre and 1/100 acre plots were again sub-divided by taking out a little strip running across the plots lengthwise of the ranges. The plots 5 x 32 links really represented what would have been alleyways in a regular experiment. I thought it advisable to get rid of the border effect which would have occurred and I used the material grown thereon just to study this particular size of plot. I think this is fairly well illustrated in the diagram appearing on page 193 of the paper.

I trust that this gives you the information which you desire.

Yours very truly,

*R. Summerby*

R. Summerby,  
Professor of Agronomy.
