W.G.Cochran Esq Rothamsted Experimental Station Harpenden. Herts.

Dear Mr Cochran,

trials as promised in my letter of 25th June 1936. The trial on field B.2.a. was planted with rows 3'6" apart, the interplant spacing in the row being 2'. Adequate guard rows were discarded, the rows divided up into 40' units and harvested seperately, the yields being given in grammes of seed cotton.

In field B.5.b. the spacing was 3'6" between rows with 18" spacing in the row, the trial being harvested in units of 30' length of row. In both trials 8' were discarded at both ends of each row to obviate any edge effect.

Actual yields were low for the following reasons
1. Planting date 6 to 8 weeks later than optimum planting
time due to late rains.

- 2. Severe damage by aphis unevenly distributed over the two fields, and further lowering of the yield by severe drought during February and March.
- 3. Both the above fields represent the extreme variation in soil fertility present on the Station and are not truly representative of the average soil fertility conditions.

In future Seasons I hope to have a series of trials on more uniform fields, and will forward the data when the crop is reaped. I shall be very pleased to hear the conclusions you have drawn when you have analysed the above data.

I enclose a plan of the lay out of the two trials me Donald
